FOR NEXT.JS APP ROUTER DEVELOPERS

Launch with fewer surprises.

Review rendering, data boundaries and the release path before your next production deployment.

4 PAGES / FILLABLE PDF / 45-MINUTE FIRST PASS

Next.js Best Practices Toolkit

A launch review and a release decision.

01 **Define your release context**

Record the version and critical route.

02 **Review the architecture**

Check rendering, caching and trust boundaries.

03 **Verify the risky paths**

Use two small patterns and release checks.

04 **Make a go / no-go decision**

Record blockers, ownership and rollback.

Website / route to review

Type into the fields or print this workbook. Save a copy after filling it in; viewer support varies.

02 / ARCHITECTURE

Make the boundaries intentional.

This toolkit targets Next.js 15 App Router, matching this portfolio. Confirm behavior against your installed version, especially on Next.js 16+.

- [ ] **Record your runtime and version**

  Run npm ls next react react-dom. Note the hosting runtime and the route being reviewed; do not assume all projects use the same defaults.

- [ ] **Choose rendering per route**

  Keep public content prerendered when it fits. Use request-time rendering when the task needs it, such as personalized content.

- [ ] **Keep client boundaries focused**

  Put state, effects and browser APIs in small Client Components. Keep server-only data and secrets on the server.

- [ ] **Isolate query-dependent UI**

  On static routes, wrap the Client Component that calls useSearchParams in a useful Suspense boundary. Confirm this in a production build.

- [ ] **Specify data freshness deliberately**

  In Next.js 15, fetch requests are not cached by default. Select no-store, force-cache or a revalidation strategy to fit the data.

- [ ] **Enforce trust at the server boundary**

  Validate untrusted input. Authorize each protected read or mutation on the server; hiding a button does not protect an operation.

- [ ] **Make localized pages discoverable**

  Check titles, canonical URLs, language alternatives and sitemap entries. Allow crawlers to load assets required to render the page.

- [ ] **Check failure and loading states**

  Use meaningful loading, error and not-found states. Test navigation, slow responses and failed submissions instead of removing boundaries by default.

03 / VERIFY

Two small patterns. One real release check.

These focused examples illustrate boundaries; they are not a full starter repository or a complete security implementation.

01 / Give static routes a query fallback

```
import { Suspense } from 'react'
import SearchFilters from './search-filters'

export default function Page() {
  return (
    <Suspense fallback={<p>Loading filters...</p>}>
      <SearchFilters />
    </Suspense>
  )
}
```

SearchFilters is a Client Component that reads useSearchParams. Keep the page content outside this boundary when it does not depend on the query.

02 / State the cache policy

```
// Public content: an explicit freshness window.
const response = await fetch(CMS_URL, {
  next: { revalidate: 3600 },
})
if (!response.ok) throw new Error('CMS unavailable')
```

Use no-store for data that must be read fresh on every request. Review authentication and cache scope before caching user-specific data.

Verify the production path

Run the project's lint, type and test checks, then a production build. On a preview deployment, inspect HTML, use keyboard navigation, switch locale and submit the critical form with controlled test data.

04 / RELEASE

Make the launch decision explicit.

Keep this record with the release. A completed checklist supports a review; it is not a security certification or a guarantee of readiness.

Release context: Next.js version / commit / preview URL / route / runtime

Blockers: issue / user impact / owner / fix or reason for accepting the risk

Decision: go or no-go / reviewer / date / checks and evidence

Rollback: known-good deployment / trigger / owner / post-launch checks

Get a second pair of eyes before launch.

Share the route you are shipping, the Next.js version and your release blockers. We can discuss architecture or launch support.
