FOR FOUNDERS, MARKETERS & DEVELOPERS

Find what makes your site feel slow.

Measure a real page, identify the likely bottleneck and leave with a short list of fixes you can verify.

4 PAGES / FILLABLE PDF / 30-MINUTE FIRST PASS

Web Performance Checklist

A baseline and a prioritized fix list.

01 **Measure before changing**

Record the page, device and starting point.

02 **Run the performance checks**

Review loading, interaction and stability.

03 **Choose fixes from evidence**

Match symptoms to practical investigations.

04 **Build a verification plan**

Assign the next fix and compare the result.

Website / route to review

Type into the fields or print this workbook. Save a copy after filling it in; viewer support varies.

02 / CHECK

Measure the experience. Then find the cause.

Start with one important URL on mobile. Use field data for real-user outcomes and lab tools to investigate repeatable problems.

LCP	INP	CLS
<= 2.5 s	<= 200 ms	<= 0.1
Loading	Responsiveness	Visual stability

Good thresholds at the 75th percentile, evaluated separately for mobile and desktop. A Lighthouse score alone does not establish a Core Web Vitals pass.

- [ ] **Record a repeatable baseline**

  Save PageSpeed Insights field data when available, plus URL, device and date. Note whether the result is page-level or origin-level.

- [ ] **Identify the actual LCP element**

  Inspect the hero image or text in a performance trace. Check when its resource is discovered and when the element becomes visible.

- [ ] **Make important media discoverable**

  Size and compress images for their display width. Avoid lazy-loading the LCP image; reserve lazy loading for offscreen media.

- [ ] **Exercise real interactions**

  Open the menu, type, filter and submit. Look for long main-thread work and expensive rendering around slow actions.

- [ ] **Reserve space before content arrives**

  Set media dimensions or aspect ratios. Test font swaps, embeds, banners and async content for unexpected movement.

- [ ] **Check the delivery path**

  Inspect slow server responses, repeated requests and caching. Keep personalized responses out of shared public caches.

- [ ] **Review third-party work**

  Measure the cost of widgets, analytics and chat. Defer nonessential work and remove scripts that no longer serve a purpose.

- [ ] **Recheck the business task**

  Repeat the same scenario after the fix. Confirm the menu, checkout or form still works and record the comparison.

03 / DIAGNOSE

Choose the fix from the symptom.

These are investigation prompts, not diagnoses. Change one bottleneck at a time and compare equivalent test conditions.

01 The hero appears late

Inspect the document response and LCP resource timing. Check server latency, image discovery and render delay. If the image starts late, make it discoverable in the initial HTML and consider a priority hint.

02 Buttons respond after a pause

Record the slow interaction. Reduce synchronous work in its handler, split large tasks and avoid rerendering an oversized component tree. Deferring a script helps only if that script caused the delay.

03 Content jumps while loading

Watch a recording with layout-shift regions visible. Reserve space for late content, stabilize font metrics and place new banners so they do not push existing content unexpectedly.

04 The lab result and real users disagree

Compare devices, networks, geography, cache state and interactions. A short lab run is a controlled sample; field data reflects a broader time window. Record both instead of choosing the nicer number.

No field data yet?

Write "not available" in your baseline, use lab tests to find problems and add real-user measurement when appropriate. A lab run cannot replace field INP.

04 / PRIORITIZE

Keep a baseline. Ship a verifiable fix.

Prioritize a broken task first, then the strongest measured bottleneck on an important route. Record the evidence for your choice.

Baseline: URL / device / date / tool / LCP / INP / CLS (use N/A where needed)

First fix: observed problem / evidence / proposed change / owner

Verification: same test conditions / before and after / regression check / review date

Interpret the result carefully

A lab improvement is an early signal. Watch real-user trends as fresh data arrives; historical field reports will not change immediately after a deployment.

Bring your baseline to a performance review.

Share your URL, your mobile report and the interaction that feels slow. We can discuss a focused performance and accessibility audit.
